Project objectives

1. To develop a centralized digital platform for reporting and managing lost and found items in a college campus.

2. To simplify the process of reporting lost and found items so students and staff can easily submit information online.

3. To implement AI-based image verification using models like YOLO and CLIP to reduce fake claims and improve item identification.

4. To improve security and transparency by maintaining a reliable digital record of all reported items.

The Lost & Found Portal is a web-based system designed to help students and staff easily report and recover lost items on campus.

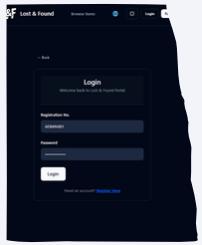
Creativity

Project

LOST & FOUND PORTAL

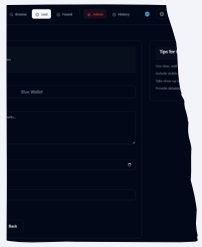
2025-26

Main activities



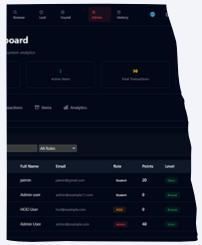
user

User Registration and Login - Users create an account and securely log in to the system.



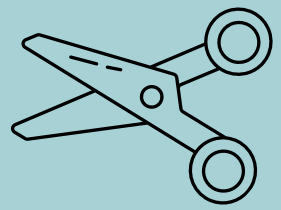
Report

- Users submit details and images of lost or found items.
- Search and Match Items - The system allows users to search and helps match lost items with found items.



Admin

Verification and Management - Admin monitors reports, verifies claims, and manages the database.



Materials

The materials required for developing the Lost & Found Portal include a computer or laptop for designing, coding, and testing the system. An internet connection is needed to access online resources and run the web-based portal. Various software tools such as Python, Flask, and code editors are used to develop the application. Additionally, a database system like SQLite or PostgreSQL is used to store and manage information related to users and lost or found items.

Stage 1

Planning and Design: In this stage, the project requirements are identified and the system design is planned. The problem of managing lost and found items in the campus is analyzed, and the structure of the portal, database, and user interface is designed.

Stage 2

Development and Implementation: In this stage, the portal is developed using programming tools such as Python and Flask. Features like user registration, reporting lost or found items, and database storage are implemented.

Stage 3

Testing and Deployment: In this stage, the system is tested to ensure it works correctly and efficiently. Errors are fixed, and the final portal is deployed so users can access it and report lost or found items easily.
